BUSINESS CONTEXT

Myntra turned profitable by selling more to the users it already has. Wishlists are the largest pool of intent it is not converting.

₹6,043 Cr	₹548 Cr	~200 M	19–20%
FY25 revenue, up 18%	FY25 profit, up 18x	annual active users	share of online fashion

Why the wishlist, and why now

- A saved item is the clearest signal a user has given: they found it, judged it worth keeping, and stopped.
- Growth now comes from existing users. 50% of the active base is Gen Z and repeat customers grew 25% year on year.
- Converting saved intent needs no acquisition spend, and the brief forbids monetary incentives.

NORTH STAR W2P-30

Users who bought ≥1 wishlisted item
within 30 days of saving it

÷ users who saved ≥1 item in the cohort window × 100

User level, not item level. The 30-day clock runs per item. Cohort must close 30 days before reporting.

Sources: Entrackr and Inc42 on Myntra FY25 filings; Inc42 on market share; The Tribune on active users.

DECISION We treat wishlist conversion as an intent problem, not a demand problem. No discounts are in scope.

METRIC DECOMPOSITION

W2P-30 has four steps. The first two are the product opportunity.

1 Re-engage

items revisited in 30d
÷ total saved items

IN SCOPE

×

2 Resolve

items with a resolving action
÷ items revisited

IN SCOPE

×

3 Add to cart

items carted in 30d
÷ total saved items

TRACKED

×

4 Purchase

items bought in 30d
÷ items carted

GUARDRAIL

Where the leak is

- 14 of 35 say they forget what they saved or never go back.
- 26 of 35 lost an item to elapsed time, not to a decision against it.
- Nothing downstream can fire if the user never returns.

Guardrails that must not move

- Return rate on wishlist purchases, +2pp is a breach.
- AOV on wishlist orders, −5% is a breach.
- Wishlist add rate, notification opt-outs, checkout completion.

SO WHAT We are not trying to fix every reason a user does not buy. We fix the upstream leak: getting saved-item users back and helping them decide.

AI DISCOVERY ENGINE

Live discovery engine → web-production-cdfaa.up.railway.app

63,014 reviews generated hypotheses. Primary research decided which ones were real.

Ingest	Filter	Classify	Count	Score	63,014	1,590	~300	0.5%
4 sources	4 gates	fixed enums	in code	3 axes	raw reviews	term + length	real signal	usable

How it avoids inventing findings

- Fixed tag lists. Any tag outside them is rejected in code, not by the prompt.
- Every count computed in Python. The model only labels.
- Elasticity is null where the survey did not ask. Never zero.

Why we did not take the corpus at face value

- App reviews and complaint subreddits over-report platform failures.
- The silent non-buyer has nothing to complain about, so never appears.
- Five of seven Reddit threads came from a complaint-only subreddit.

Hypothesis	Verdict	Evidence
Structural blockers dominate non-conversion	CHALLENGED	Loud in Play Store and Reddit. Raised unprompted by 0 of 4 interviewees.
Users cannot verify what will arrive	SUPPORTED	3 of 4 interviews. 11 of 35 chose buyer reviews and photos as the top fix.
Users forget what they saved	SUPPORTED	14 of 35. Also the most common reason a saved item goes stale.
Price is the real blocker	PARTLY	14 of 35 cite it and it converts well, but the only fix is a discount.

DECISION Corpus output is a hypothesis generator. Where sources disagree, primary research wins.

PRIMARY RESEARCH

Interview notes Reddit threads Survey responses

Three of four interviewees cannot confirm what will arrive.

One is simply waiting for money, and we cannot help him.

	What they buy	Uses wishlist	What blocks them	In segment
P1	Luxury shoes, watches	Yes, as a holding queue	Cannot afford it yet	EXCLUDED
P2	Clothing	Yes	No reviews feels like a risk of being deceived	YES
P3	Clothing	No, buys offline	Believes a discount signals a defect	YES
P4	General fashion	Yes, heavily	Forgets to return, and photos are missing	YES

11 of 35
want buyer reviews
and photos most

6 of 6
blocked by quality doubt
chose that same fix

14 of 35
forget what they saved
or never go back

26 of 35
lost the item to time,
not to a decision

Survey n=35 after screening. Four respondents said they had no unbought saved item, then answered anyway, so they are excluded. Counts are reported, never percentages.

DECISION We target verification-blocked users and exclude budget-blocked ones, because their only fix is a discount.

PROBLEM DEFINITION

A saved item sits untouched until the user happens to remember it, and the answer that would settle their doubt is buried when they arrive.

1 Nothing brings the user back

- The wishlist heart carries no badge, while the bell and the bag both do. The mechanism exists in the same toolbar.
- In none of the four interviews did the wishlist itself prompt a return visit.

2 The answer is buried on arrival

- One product carried 189 buyer photos, sitting below product details, trust badges and Similar Products.
- The information that resolves the doubt is present and unreachable at the moment of decision.

Blocker	Cited	Would buy if fixed	Read
Waiting for the price to drop	8	5	Common and elastic, but the fix is a discount
More than I want to spend	6	4	Same problem, out of scope
Size or item unavailable	5	3	Product can notify even if it cannot stock
Cannot decide between two items	6	3	Buyer photos serve this too
Quality will not match the photos	6	2	Loudest blocker, weakest elasticity
Not sure it will fit	3	0	Denominator too small to rank on

DECISION Verification and re-engagement ship together. Neither works alone: a reminder with no answer just moves the drop-off one stage later.

SOLUTION RATIONALE

RICE puts the badge first on its own. We ship it paired with review answers,

because bringing users back to an unanswered question wastes the visit.

Option considered	Reach	Impact	Conf.	Effort	RICE	Call
Change badge and Changed filter	14/35	2	70%	1	**19.6**	**SHIP**
Instant Reviews and buyer photos	12/35	2	70%	3	**5.6**	**SHIP**
Price-drop alerts as the core feature	14/35	2	80%	2	11.2	DEMOTED
Generic “still sitting there” reminder	35/35	0.5	60%	1	10.5	REJECTED
Size guide and fit predictor	3/35	1	50%	4	0.4	REJECTED
Price history chart as the default view	14/35	1	50%	2	3.5	REJECTED

Why each loser lost

- Price alerts: the fix is a discount, and P3 reads a discount as a defect signal.
- Generic reminder: reaches everyone, says nothing, becomes wallpaper.
- Size predictor: 3 of 35 affected, none of whom would buy if fixed.

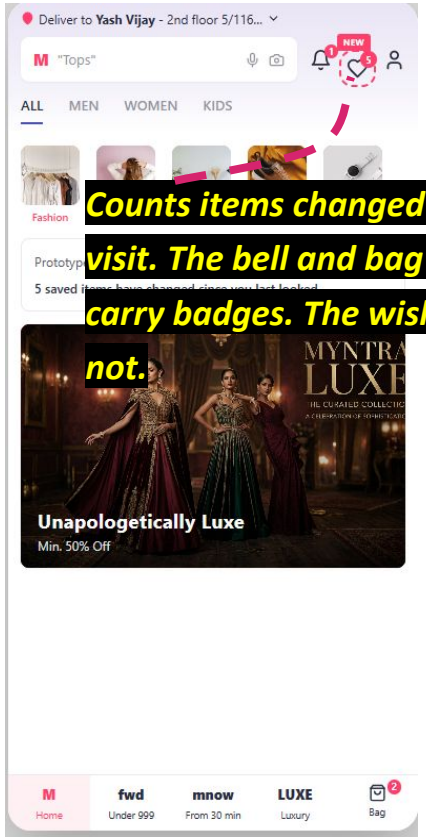

What we build instead of a chart

- A chart teaches waiting. A verdict closes the decision.
- “Cheaper only 2 of 26 weeks” beats a graph the user must interpret.
- The chart is still there, one tap away.

DECISION Ship the badge and Instant Reviews together. Price is one of six change types, never the headline.

Live MVP → myntra-mvp-wpc-production.up.railway.app

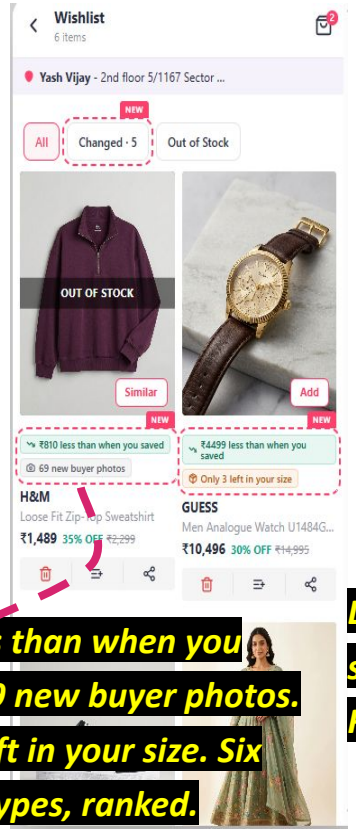

1 Badge on the heart

Counts items changed since last visit. The bell and bag already carry badges. The wishlist does not.

RE-ENGAGE

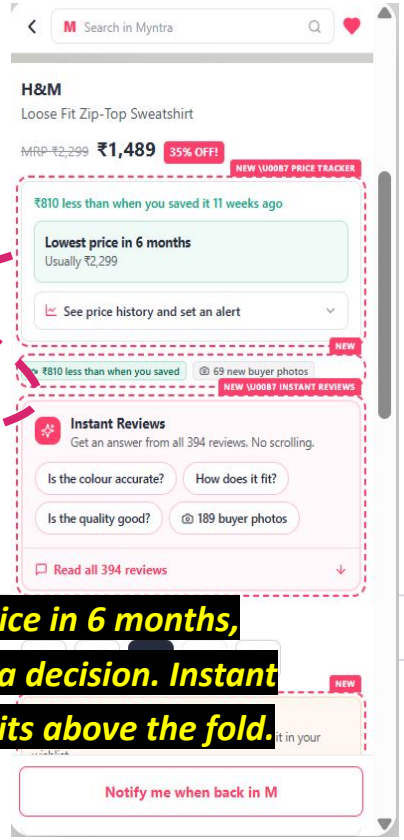

2 Changed filter and chips

₹810 less than when you saved. 69 new buyer photos. Only 3 left in your size. Six change types, ranked.

RE-ENGAGE

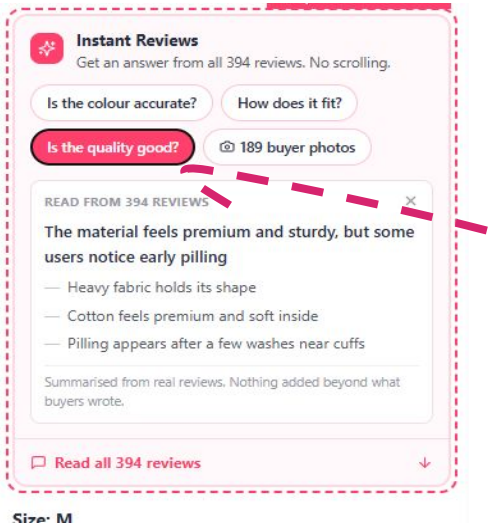

3 Verdict on arrival

Lowest price in 6 months, stated as a decision. Instant Reviews sits above the fold.

RESOLVE

4 The doubt, answered

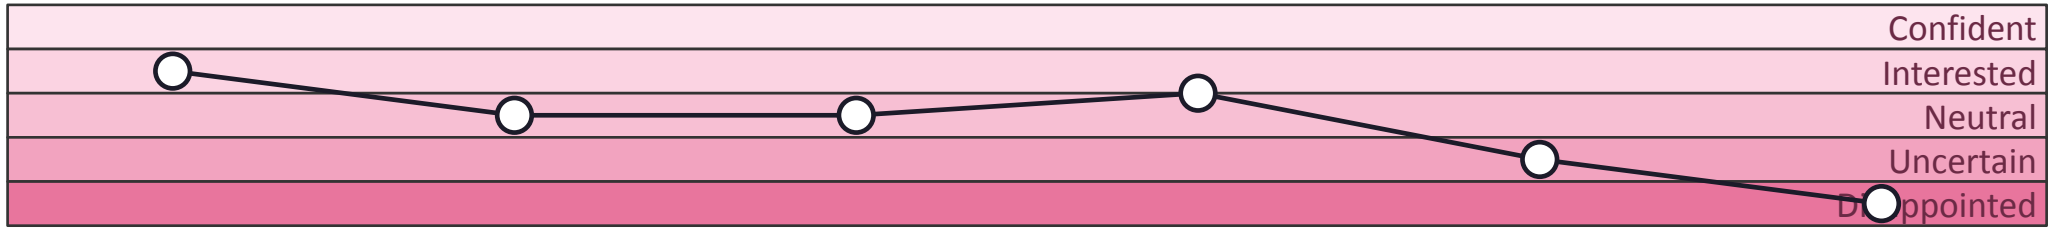

RESOLVE

Reports early pilling as readily as premium fabric. A user who reads and does not buy has been served.

Four screens, two mechanisms: bring them back when something changed, then answer the exact doubt without making them scroll.

CUSTOMER JOURNEY · A SAVED ITEM

A saved item can change while the user is away, then require fresh research when they return.

Stage	Saves the item	Weeks pass	The item changes	Returns by chance	Tries to verify	Buys elsewhere
What they do	Taps the heart while browsing. Does not add to bag.	Opens Myntra for something else. Never opens the wishlist.	Price drops. Their size sells out. 69 buyer photos appear.	Searches for the same item again, not knowing it is saved.	Wants the real colour and fit. Scrolls, gives up, or leaves.	Checks another platform, or finds something newer.
What they think	*"I want this, just not right now."*	*"What did I even save in there?"*	*(the user is told none of this)*	*"Didn't I look at this before?"*	*"Will it actually look like the photo?"*	*"I'll just get it somewhere else."*
How they feel						
What breaks	Nothing marks it as intent versus a bookmark.	14 of 35 forget or never go back.	The heart carries no badge. The bell and bag do.	Discovery work is repeated from scratch.	Reviews sit below details, badges and Similar Products.	16 of 35 found something better.

SO WHAT The two lowest points are both ours: nobody told them the item changed, and nobody answered the question when they came back.

DEFINING SUCCESS

Ship at +3pp on W2P-30 with every guardrail held. Kill below +1pp, or the moment returns rise.

Tier	Metric	Definition	Why this one
North star	W2P-30	Users buying ≥1 saved item in 30d ÷ users who saved × 100	Holds us to intent we already have
Primary	Re-engagement rate	Items revisited in 30d ÷ total saved items × 100	Most upstream gate, largest gap
Primary	Resolution rate	Items with a resolving action ÷ items revisited × 100	A decision not to buy still counts
Leading	Badge open rate	Opens from a badged state ÷ badged sessions × 100	Decay means it became wallpaper
Leading	Instant Reviews usage	Question opens ÷ saved-item PDP sessions × 100	Adoption, never success on its own
Guardrail	Return rate	Returns ÷ wishlist-sourced purchases × 100	Breach at +2pp. The critical one

Also guarded: AOV on wishlist orders (breach at −5%), notification opt-outs (3%), wishlist add rate, and checkout completion.

PILOT CONTRACT
8 weeks. Users with ≥5 saved items and no wishlist purchase in 60 days, against a held-out control.

SHIP
+3pp or better, guardrails held

ITERATE
+1 to +3pp, guardrails held

KILL
below +1pp, or any guardrail breached

The pilot cannot report before week 8. A 30-day metric read at week 4 is a truncated metric that will understate.

DECISION No expansion without clearing the gate. A rising W2P-30 alongside rising returns is a failure, not a win.

RISKS AND MITIGATION

Two failures would kill this: a badge nobody reads, and conversions that come back as returns.

Risk	Sev.	Mitigation built in	Signal we watch
The badge becomes wallpaper	HIGH	Counts changed items, not saved items. Clears on open. Goes quiet after 4 unopened days.	Badge open rate over time, weekly
Converting users into returns	HIGH	No urgency language. Reviews report thin fabric and small sizing honestly.	Return rate, split by Instant Reviews use
Instant Reviews invents something	HIGH	Only that product's reviews reach the model. Zero-review products never do.	Weekly hand-audit, target >98% grounded
Price alerts depress margin	HIGH	Verdict is the default, chart is opt-in. Price is one of six change types.	AOV against control, breach at −5%
A discount reads as a defect warning	MED	Restock and new photos rank above price drop in notifications.	Conversion by change type
Notification fatigue	MED	WhatsApp is opt-in per item at a user-set price, with a daily cap.	Opt-out rate, breach at 3%
The corpus may have misled us	MED	The MVP serves both readings: notify-me for structural, Instant Reviews for verification.	Conversion by change type settles it

Known limitations: 4 interviews against the 5 to 6 asked for, survey n=35 convenience sampled, some elasticity denominators of 3 or fewer, and a 6-month Play Store corpus with only 124 Hindi records of 63,014.

DECISION Badge decay and return rate are read weekly, not at the end. Both are cheap to fix early and expensive to fix late.
